

# Guideline for importing biological parts

1. First things first. Decide which type of material you will import.

2. Then, you'll need to know which entity will inspect your material. In Brazil, ANVISA is the one which has the best conduct when it comes to biological parts.

3. Think carefully if you will import as a natural or legal person (by your institution). There are some differences of procedures, documents and material you can import in each of these forms. Choose the one that suits you better.

# Guideline for importing biological parts

Consider some of the following while importing

Natural person

“My regulatory agency has some guide to help a natural person to import on his/her own?”

“Should I contact directly the carrier enterprise?”

“Is there some partnership between the regulatory agency and the federal entity for scientific development, to facilitate these procedures?”

Legal person

“Is there some agreement between my institution and the one which is sending me the material to make it easier and faster?”

“Is there some agreement between my institution and the regulatory agency?”
