

Congress of the United States
House of Representatives
Washington, DC 20515-0403

“Advances in synthetic biology and biomedical engineering are critical to keeping our armed forces competitive at the highest level. This type of technology will allow the U.S. Military to produce bioinspired machines and systems with novel capabilities that can be integrated with Warfighter equipment for advanced situational awareness. eNose is an exceptional invention that has the potential to save many lives. I am proud of this group and look forward to following this competition through completion.”

Steve Womack
Member of Congress
